

The PTENSYS® Triage Bag contains everything needed to bring basic organization to a chaotic scene and initiate priority treatments for immediate life threatening conditions. Simple and easily accessible triage tape helps categorize patients for treatment and transport.

Battle-tested supplies enable control of major hemorrhage, airway compromise, and pneumothorax. Be it in sports and entertainment venues, transport hubs, hotels, malls, schools or at a pre-planned special event, the PTENSYS® Triage Bag brings critical abilities to an MCI early, when and where they are most needed.

The PTENSYS® Airway Bag augments the initial airway capabilities of the PTENSYS® Kit bag. While many MCI patients are well managed with basic techniques and airway adjuncts, the well trained medical provider will find the more advanced airway management provided by the Airway Bag's supraglottic devices to be beneficial in many complex situations.

It contains both supraglottic devices and additional basic airway adjuncts that sit within the PTENSYS® Kit bag and can also be added to the PTENSYS® Cabinet as an additional resource for when incidents lead to greater numbers of patients with respiratory compromise.

**Introducing
everything
you need to
treat burns in
one unique kit.**

The PTENSYS® burns kit carries all the essential items for treating burn injuries in one easily accessible location, allowing immediate treatment. These kit bags are designed to be highly recognisable and easily distinguishable from the other essential PTENSYS® emergency kits.

The contents in this unique kit are particularly appropriate for dealing with chemical, biological, radiological and

nuclear (CBRN) situations. The use of these is one of the risks that deliberate attacks present. Alternatively, these kits can also be used in a setting where chemicals are produced.

Each floodlit kit bag contains a selection of essential supplies including water gel and gauze and is designed to treat at least four patients.
